

75 V, up to 15 A, DC-DC buck converter based on the L3751 controller

Features

- 6 to 75 V wide input voltage range
- Selectable two-output voltage level: 5 or 12 V
- 230 kHz switching frequency setting
- Low drop-out operation during line transient
- Pulse skipping or forced PWM operation at light load
- Synchronization from 185 to 345 kHz
- Power good open collector output validates the VOUT
- 7.5 V gate drivers for standard V_{th} MOSFETs
- Constant current protection with hiccup mode
- Current sensing on rds-on low-side
- Improved line-transient response
- Input voltage undervoltage lockout
- Internal voltage monitoring
- Thermal protection
- Operating junction temperature range: -40 to 150°C

Description

The 6 to 75 V wide input voltage range [STEVAL-L3751V12](#) synchronous buck evaluation board features an extreme voltage conversion ratio over switching frequency.

The board provides a regulated 5 V output at 230 kHz switching frequency. The output voltage can be easily set to 12 V using a jumper connector. Different voltage output can be selected by changing a resistor to a lower V_{IN} range.

The [STEVAL-L3751V12](#) is a 100 W demo board. The default maximum current is set to 15 A. It can be easily selected by changing a resistor.

The evaluation board is based on the [L3751](#) synchronous buck controller, which implements the voltage mode in a VQFN package.

The diode emulation (DEM) implements the pulse-skipping mode, which maximizes the efficiency at light-load with a controlled output voltage ripple.

The forced PWM (FPWM) over-the-load range makes the switching frequency constant and minimizes the output voltage ripple.

The power good open collector output validates the regulated output voltage for monitoring. It implements the output voltage sequencing for digital ICs during the power-up phase.

The embedded gate driver is designed for standard V_{th} MOSFET and minimizes the number of external components.

The embedded protections, such as the output overcurrent, the input voltage UVLO, the internal voltage monitoring, and the thermal shutdown at 150°C degrees, feature a controlled and safe operation for critical environments in telecom, networking, and industrial applications.

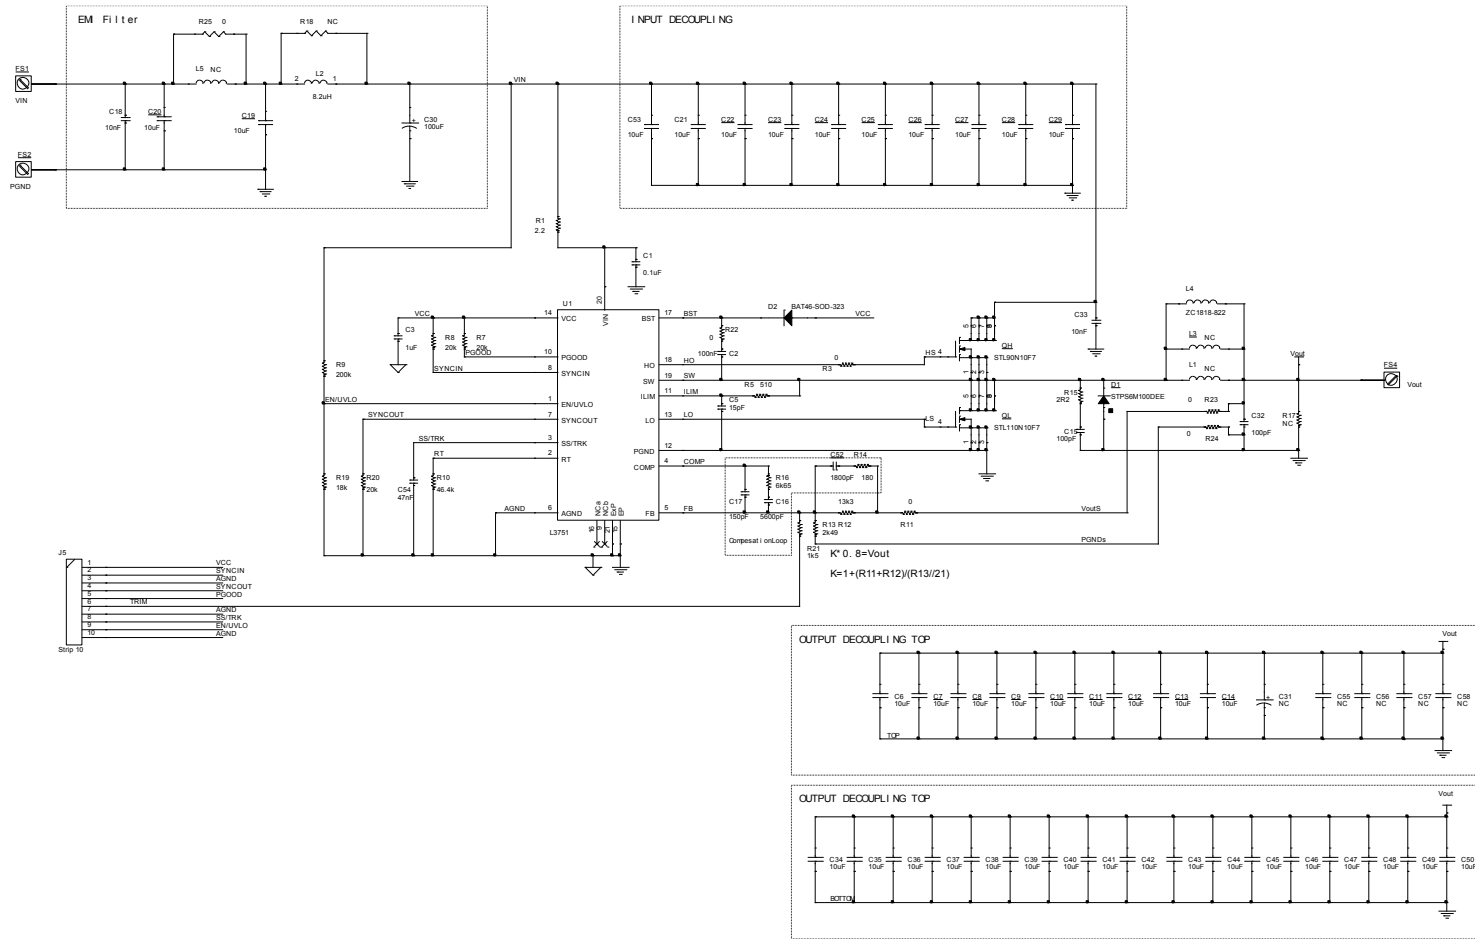

You can use the [eDesignSuite](#) software tool to configure the [L3751](#) buck converter and satisfy the application requirements.
